

# MARINE GENERATOR SET

*Generators Set is a complete set of mechanical equipment that converts other forms of energy into electrical energy. It consists of a power system, a control system, a noise reduction system, a damping system, and an exhaust system. It is driven by a water turbine, a steam turbine, a diesel engine, or other power machinery. The energy generated by the airflow, fuel combustion or nuclear fission is converted into mechanical energy and transmitted to the generator, which is then converted into electrical energy by the generator and output to the electrical equipment. Generators have a wide range of uses in industrial and agricultural production, national defense, technology and daily life. In recent years, with the advancement of technology, as a high-quality choice for household emergency power supply and field travel power, lightweight portable, small generator sets have begun to enter the daily life of residents.*
